# Apply filters to SQL queries

#### Project description

The management at my organization has asked me to investigate potential security issues and update employee computers as required. As a Linux administrator, I used SQL with filters to perform security-related tasks.

#### Retrieve after hours failed login attempts

There were suspicious activities that occurred after business hours (after 18:00). All after hours login attempts that failed need to be investigated.

I created a SQL query on MariaDB to filter for failed login attempts that occurred after business hours.

MariaDB [org	anization]>					3:00' AND success = 'FALSE';	
event_id		login_date		country	ip_address	success	
2				•	192.168.205.12

199	yappiah	2022-05-11	19:34:48	MEXICO	192.168.44.232	0	
rows in set, 1 warning (0.116 sec)							

The result is based on the log\_in\_attempts table where the login\_time column is after
18:00 and the login attempts are failed (0). The filter "Select \* " means to select everything (all columns) and FROM log\_in\_attempts means it is from the log\_in\_attempts table.
Success indicates the status of the login. If it is zero, it is a failure whereas if it is one, it is a success. Therefore, there were 19 failed login attempts after 18:00.

# Retrieve login attempts on specific dates

A suspicious event occurred on 2022-05-09. Any login activity that happened on 2022-05-09 or on the day before needs to be investigated. Therefore, I created a SQL query to filter for login attempts that occurred on specific dates.

MariaDB [organization]> SELECT *									
->									
-> FROM log in attempts									
->									
-> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';									
++	+				+	++

                                                                                    0 1
      197 | jsoto
                                    09:05:09
75 rows in set (0.001 sec)
```

I selected the <code>log\_in\_attempts</code> table and used the <code>WHERE</code> clause and <code>OR</code> operator to filter my results to output only login attempts that occurred on 2022-05-05 or 2022-05-08. As a result, there were 75 login attempts in these two days.

#### Retrieve login attempts outside of Mexico

After investigating the data and following the pattern, there is a strong indication that login attempts outside of Mexico should be investigated.

I created a SQL query to filter for login attempts that occurred outside of Mexico.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
 event_id | username | login_date
                                   | login_time |
                                                 country
                                                           ip_address
                                                                              success

144 rows in set (0.001 sec)
```

I used the WHERE clause and NOT operator to filter the outputs and receive the login attempts outside Mexico. However, the word "Mexico" could be "Mex", "MEX", and etc. To simplify this, I chose LIKE with MEX% as the pattern to match as MEX and MEXICO. The % sign indicates any unspecified characters when used with LIKE. As a result, there were 144 login attempts outside Mexico.

#### Retrieve employees in Marketing

My team wants to update certain computers across departments. I created a SQL query to filter for employee machines from employees in the Marketing department in the East building.

MariaDB [organization]> SELECT * -> -> FROM employees;								
employee_id	device_id	username		office				
	a320b137c219							
1001	b239c825d303	bmoreno	Marketing	Central-276				
1002	c116d593e558	tshah	Human Resources	North-434				
1003	d394e816f943	sgilmore	Finance	South-153				
1004	e218f877g788	eraab	Human Resources	South-127				
1005	f551g340h864	gesparza	Human Resources	South-366				
1006	g329h357i597	alevitsk	Information Technology	East-320				
1007	h174i497j413	wjaffrey	Finance	North-406				
1008	i858j583k571	abernard	Finance	South-170				
1009	NULL	lrodriqu	Sales	South-134				
1010	k2421212m542	jlansky	Finance	South-109				
1011	1748m120n401	drosas	l Sales	South-292				

```
MariaDB [organization] > SELECT *
   -> FROM employees
   ->
   -> WHERE department = 'Marketing' AND office LIKE 'East%';
 employee id | device id
        1000 | a320b137c219 | elarson | Marketing
                                                    | East-170
        1052 | a192b174c940 | jdarosa | Marketing | East-195
        1075 | x573y883z772 | fbautist | Marketing | East-267
        1088 | k8651965m233 | rgosh
                                       | Marketing | East-157
        1103 | NULL
                            | randerss | Marketing
               a184b775c707 | dellery | Marketing
        1156 |
        1163 | h679i515j339 | cwilliam | Marketing
 rows in set (0.001 sec)
```

I first selected all the data in the <code>employee</code> table and used the <code>WHERE</code> clause to filter employees who are part of the marketing team and reside in the east building using <code>AND</code> office <code>LIKE 'East%';</code> . As a result, there are 7 employees who match the criteria.

### Retrieve employees in Finance or Sales

Across departments, plenty of employee data needs to be updated. I created a SQL query to filter for employee machines from employees in the Finance or Sales departments.

```
MariaDB [organization] > SELECT *
    ->
    -> FROM employees
    ^
    -> WHERE department = 'Finance' OR department = 'Sales';
  employee_id | device_id
                                         department | office
                             username
         1003 | d394e816f943 | sgilmore |
                                          Finance
                                                      South-153
         1007 | h174i497j413 | wjaffrey | Finance
                                                      North-406

```

I selected the Finance department and Sales department. By using the WHERE clause and OR operator I filtered the outputs to make sure all employees who are members of both departments are listed. As a result, there are 71 people who happen to be members of both departments.

### Retrieve all employees not in IT

I created a SQL query to filter for employee machines from employees not in the Information Technology department.

```
MariaDB [organization] > SELECT *
   -> FROM employees
   -> WHERE NOT department = 'Information Technology';
                          | username | department
 employee id | device id
                                                     office
        1000 | a320b137c219 | elarson | Marketing
                                                   | East-170
        1001 | b239c825d303 | bmoreno | Marketing
                                                    | Central-276
        1002 | c116d593e558 | tshah | Human Resources | North-434

First, I started by selecting all data from the employee table. Then, I used a WHERE clause with NOT to filter for employees not in the IT department.

## Summary

I applied filters to SQL queries to get specific information on <code>employee</code> and  $log_in_attempts$  tables. I used the AND, OR, NOT operators to filter for the specific information and I used LIKE and the (%) sign filter for patterns.
